copilot-pdf-playbook

Copilot-Assisted Document-to-PDF Playbook

Bajaj Finance Limited | M365 Copilot Training — Payments (Sales), Field

Purpose

This guide describes a robust, repeatable process for transforming large amounts of content and images into a professionally formatted PDF using Microsoft Copilot and Microsoft Word.

In Payments field sales, typical uses are a merchant leave-behind (product and FAQ), a monthly team review pack, or a new-joiner FOS handbook.

The process is designed for:

- Up to 50 pages of content
- Up to 30 images
- Upload-constrained environments
- Users with minimal document-engineering experience
- Situations where content completeness is critical

Core Principle

Do not ask Copilot to create a document from scattered source files.

Instead:

1. Consolidate all content into a single source document.
2. Provide sufficient structure and metadata.
3. Use Copilot to transform and enhance the document.
4. Export the validated result to PDF.

This minimizes content loss and reduces dependency on upload limits.

Target Workflow

```
Source Content
      +
Images
      ↓

SOURCE.docx
      ↓

Upload to Copilot
      ↓

Transform to FINAL.docx
      ↓

Validate
      ↓

Export PDF
      ↓

FINAL.pdf
```

Phase 1 – Prepare Source Material

Gather:

- All textual content
- All images
- Existing headings
- Existing tables
- Existing appendices

Create a working folder.

```
Project
│
├── Images
│
├── SOURCE.docx
│
├── FINAL.docx
│
└── FINAL.pdf
```

Phase 2 – Assign Image Identifiers

Every image must receive a unique identifier.

Use this format:

```
FIG-001
FIG-002
FIG-003
...
FIG-030
```

Do not use:

```
Image 1
Image A
Screenshot
Chart Final
Diagram Latest
```

Identifiers must remain stable throughout the process.

Phase 3 – Build the Source Document

The source document becomes the single source of truth.

Create:

```
SOURCE.docx
```

Recommended Source Document Structure

Cover Page

Example:

```
Document Title

Version 1.0

Source Document for Copilot Transformation
```

Image Manifest

Create a master catalog of all images.

Example:

Figure ID	Title
FIG-001	Activation within 7 Days by FOS, Jul–Sep 2026
FIG-002	Merchant Onboarding Journey
FIG-003	Payment Value by Product

Purpose:

- Tracks all images
- Simplifies validation
- Reduces accidental image loss

Main Content

For each image use the following structure.

Example

```
Section Title

Paragraph content.

FIGURE REFERENCE:
FIG-001

Purpose:
Shows activation within 7 days by FOS against the 80% target.

<INSERT IMAGE>

Caption:
Activation within 7 Days by FOS, Jul–Sep 2026
```

Image Placement Standard

Every image should contain four components:

```
1. Figure Identifier
2. Purpose Statement
3. Embedded Image
4. Caption
```

Example:

```
FIGURE REFERENCE:
FIG-007

Purpose:
Shows the steps from lead to first transaction.

<IMAGE>

Caption:
Merchant Onboarding Journey
```

This creates sufficient context for Copilot even if the image itself contains complex information.

Table Standard

Important tables should also receive identifiers.

Example:

```
TABLE REFERENCE:
TBL-001

<INSERT TABLE>

Caption:
FOS Scorecard — September 2026
```

Use:

```
TBL-001
TBL-002
TBL-003
...
```

Phase 4 – Source Document Quality Check

Before uploading to Copilot verify:

Images

- Every image has a Figure ID
- Every image has a caption
- Every image has a purpose statement
- Every image appears in the manifest

Tables

- Every important table has a Table ID
- Every table has a caption

Content

- All sections are present
- No duplicate sections
- No placeholder text remains

Phase 5 – Upload to Copilot

Upload:

```
SOURCE.docx
```

Only.

Treat this document as the authoritative source.

Payments Sales Example — Merchant Leave-behind

A one-to-two page sheet an FOS leaves with the merchant after a visit.

```
SOURCE.docx
│
├── Cover: "Accept digital payments — UPI QR, Soundbox, Android POS, Payment Link"
├── Image manifest (FIG-001 … FIG-003)
├── 1. Which product suits your shop ....... TBL-001  (from the offer sheet, section 1)
├── 2. How onboarding works ................ FIG-002
├── 3. Rentals and waivers ................. TBL-002  (offer sheet 1.2, 1.3)
├── 4. Settlement — when the money arrives .. (offer sheet 4.1, 4.3)
├── 5. Common questions answered ........... (offer sheet section 5)
└── Your FOS: name and contact
```

Write the content from the official offer sheet only, paste it into SOURCE.docx with its IDs, then run the Production Prompt

below unchanged.

> The production prompt forbids new factual content. That matters here: anything a merchant keeps must match the official prices and terms exactly.

Phase 6 – Transformation Prompt

Use the following prompt as-is.

Production Prompt

```
The uploaded document is the complete source of truth.

Transform the document into a professional publication-ready Word document.

Requirements:

1. Preserve all content.
2. Do not summarize.
3. Do not omit any content.
4. Do not create new factual content.
5. Preserve every section.
6. Preserve every appendix.
7. Preserve all figure identifiers.
8. Preserve all table identifiers.
9. Preserve figure-to-content relationships.
10. Preserve table-to-content relationships.
11. Maintain all captions.
12. Create a professional heading hierarchy.
13. Create a table of contents.
14. Improve typography and spacing.
15. Improve consistency of styles.
16. Improve visual presentation.
17. Ensure the document remains suitable for PDF publication.
18. Treat the uploaded document as authoritative and complete.

Output a complete transformed document.

Before finalizing, verify:

- Every section is present.
- Every figure identifier is present.
- Every image is present.
- Every table identifier is present.
- No content has been removed.
```

Phase 7 – Validate the Result

Validation is mandatory.

Never export directly to PDF.

Structural Validation

Verify:

- All sections exist
- All appendices exist
- Table of contents is generated

Figure Validation

Search:

```
FIG-
```

Compare:

```
Source Document Count
vs
Final Document Count
```

Both should match.

Example:

```
Source: 27 Figures
Final: 27 Figures
```

Table Validation

Search:

```
TBL-
```

Compare counts.

Both should match.

Spot Review

Review:

- First section
- Middle section
- Final section

This catches most transformation errors quickly.

Phase 8 – Recovery Prompt

Use this only if content is missing.

```
Compare the output document against the uploaded source document.

Identify every missing:

- Section
- Figure
- Table
- Appendix
- Caption
- Paragraph

Restore all missing content.

Do not modify correctly preserved content.
```

Phase 9 – Export to PDF

Once validation succeeds:

```
File
→ Save As
→ PDF
```

or

```
File
→ Export
→ Create PDF
```

PDF Quality Checklist

Before distribution confirm:

- Title page correct
- TOC correct
- Images render correctly
- Captions present
- Tables render correctly
- Page breaks correct
- No blank pages
- Appendices present
- PDF opens correctly

Best Practices

Do

- Use one source document
- Use stable figure identifiers
- Use figure captions
- Use purpose statements
- Validate before PDF export
- Keep the document as the single source of truth

Don't

- Upload dozens of independent files
- Depend on image filenames
- Ask Copilot to recreate content from memory
- Skip validation
- Export directly to PDF without review

Golden Rule

Ask Copilot to transform and improve a complete document.

Do not ask Copilot to reconstruct a document from fragmented inputs.

Document transformation is significantly more reliable than document generation.
